Medical Incidents by Type

*Based on response time target details provided by AHS with a median time of eight (8) minutes and 90th percentile response time of twelve (12) minutes.

References: All data has been filtered to First Truck on-scene and includes both urban and rural incidents. Estimates for EMS response times are calculated using FRESO dispatch time - future iterations will use actual dispatch times for EMS from AHS when available. Automatic Medical Incidents are those coded as DELTA or ECHO (typically of high severity in which Fire is dispatched automatically). No Outlier policy has been applied to this data - as such, there can be marginal differences between reported operational data and this statistical summary. Medical incidents are now being totaled to exclude any records in which Fire was cancelled before arriving on-scene.
